```
In [22]:

1 import scipy
2 from scipy import stats
3 import pandas as pd
4 import math
```

- V prvnim pripade se jedna o pravy test (pred/po -- parova data)
- V druhem pripade se jedna o dvouvyberovy t-test (dva vybery)

## RUCE

Out[12]: Ttest\_relResult(statistic=-3.1814457556571267, pvalue=0.00873863596242495)

```
• H0: same E(X)
```

- H1: different E(X)
- a = 0.01
- pvalue=0.008 < 0.01 ... zamitame H0 zamitame stejne stredni hodnoty

## **ZUBY**

```
In [20]: 1 data = pd.read_csv("data-zuby.txt", delimiter=" ")
2 stats.ttest_ind(data["zuby_pomlau"], data["zuby_sok"])
```

Out[20]: Ttest\_indResult(statistic=2.019354722091951, pvalue=0.06302124008545723)

- H0: same E(X)
- H1: different E(X)
- a = 0.05
- pvalue=0.06 > 0.05 ... nezamitame H0, ve prospech toho ze dva vybery maji ruzne stredny hodnoty

## Konfidencni interval:

95% konfidencni interval pro rozdil strednich hodnot sily potrebne k drceni je: [0.149, 2.176]
